$\qquad$
$\qquad$ < KEY > $\qquad$

Closed book and notes. No calculators.
Designed for 60 minutes, but time is essentially unlimited.
Cover page, four pages of exam.
This test covers through Section 2.7 of Montgomery and Runger, fourth edition.
Throughout, you will receive full credit if someone with no understanding of probability could simplify your answer to obtain the correct numerical solution.

A true/false question is true only if it is always true. If any conditions exist for which the statement is not true, then mark "false".

Score $\qquad$

Closed book and notes. 60 minutes.

1. True or false. (For each: three points if correct, zero point if blank, -1 point if wrong)
(a) $\mathrm{T} \leftarrow \mathrm{F} \quad$ If events $A$ and $B$ partition the sample space, then $\mathrm{P}(A)+\mathrm{P}(B)=1$.
(b) $\mathrm{T} \quad \mathrm{F} \leftarrow \quad$ If events $A$ and $B$ are mutually exclusive, then $\mathrm{P}(A)+\mathrm{P}(B)=1$.
(c) $\mathrm{T} \quad \mathrm{F} \leftarrow \quad$ Bayes's Rule applies only to independent events.
(d) $\mathrm{T} \quad \mathrm{F} \leftarrow \quad$ For all events $A$ and $B, \mathrm{P}(A \mid B)=\mathrm{P}(A \cap B) / \mathrm{P}(B)$.
(e) $\mathrm{T} \leftarrow \mathrm{F} \quad$ For all events $A$ and $B, \mathrm{P}(A \cap B)=\mathrm{P}(A)+\mathrm{P}(B)-\mathrm{P}(A \cup B)$.
(f) $\mathrm{T} \leftarrow \mathrm{F} \quad$ For all events $A$ and $B, \mathrm{P}(B)=\mathrm{P}(B \mid A) \mathrm{P}(A)+\mathrm{P}\left(B \mid A^{\prime}\right) \mathrm{P}\left(A^{\prime}\right)$.
(g) $\quad \mathrm{T} \leftarrow \mathrm{F} \quad$ For all independent events $A$ and $B, \mathrm{P}(A \cap B)=\mathrm{P}(A) \mathrm{P}(B)$.
(h) $\quad \mathrm{T} \leftarrow \mathrm{F} \quad$ If event $A$ is a subset of the event $B$, then $\mathrm{P}(A) \leq \mathrm{P}(B)$.
(i) $\mathrm{T} \leftarrow \mathrm{F} \quad$ If $n$ and $r$ are non-negative integers with $r \leq n$, then

$$
C_{r}^{n}=\binom{n}{r}=\frac{n!}{r!(n-r)!} .
$$

2. (10 points) (Montgomery and Runger, Edition 4, Problem 2-47). In a chemical plant, twenty-four holding tanks are used for final product storage. Four tanks are selected at random and without replacement. Six of the twenty-four tanks contains material in which the viscosity exceeds the customer requirements.
Determine the probability that at least one tank in the sample (of four tanks) contains high-viscosity material.

Experiment: Randomly choose, without replacement, four tanks from the 24 tanks.
Let $H_{i}=$ "the $i$ th tank chosen contains high-viscosity material", $i=1,2,3,4$.
Then P( "at least one of the four tanks contains high-viscosity material" )

$$
\begin{aligned}
& =1-\mathrm{P}(\text { "none of the four tanks contains high-viscosity material" }) \\
& =1-\mathrm{P}\left(H_{1}{ }^{\prime} \cap H_{2}{ }^{\prime} \cap H_{3}{ }^{\prime} \cap H_{4}{ }^{\prime}\right) \\
& =1-\mathrm{P}\left(H_{1}{ }^{\prime}\right) \mathrm{P}\left(H_{2}{ }^{\prime} \mid H_{1}{ }^{\prime}\right) \mathrm{P}\left(H_{3}{ }^{\prime} \mid H_{1}{ }^{\prime} \cap H_{2}{ }^{\prime}\right) \mathrm{P}\left(H_{4}{ }^{\prime} \mid H_{1}{ }^{\prime} \cap H_{2}{ }^{\prime} \cap H_{3}{ }^{\prime}\right) \\
& =1-[(18 / 24)(17 / 23)(16 / 22)(15 / 21)] \leftarrow
\end{aligned}
$$

$\qquad$
$\qquad$ < KEY > $\qquad$
3. (ten points) (Montgomery and Runger, Edition 4, Problem 2-88). Suppose that $A$ and $B$ are mutually exclusive events. Construct a Venn diagram that contains the three events $A, B$, and $C$ such that $\mathrm{P}(A \mid C)=0$ and $\mathrm{P}(B \mid C)=1$.

To represent the sample space, sketch a rectangle and label it $S$.
To represent mutually exclusive events, sketch two non-overlapping circles in the rectangle; label them $A$ and $B$.
To represent the two probability conditions, sketch a circle inside circle $B$; label it $C$.
4. (Montgomery and Runger, Edition 4, Problem 2-117). Suppose that $\mathrm{P}(A \mid B)=0.4$, $\mathrm{P}\left(A \mid B^{\prime}\right)=0.2$, and $\mathrm{P}(B)=0.8$.
(a) (six points) Determine the value of $\mathrm{P}(A)$.

$$
\begin{aligned}
\mathrm{P}(A) & =\mathrm{P}(A \mid B) \mathrm{P}(B)+\mathrm{P}\left(A \mid B^{\prime}\right) \mathrm{P}\left(B^{\prime}\right) & & \text { total probability } \\
& =\mathrm{P}(A \mid B) \mathrm{P}(B)+\mathrm{P}\left(A \mid B^{\prime}\right)[1-\mathrm{P}(B)] & & \text { complement } \leftarrow \\
& =(0.4)(0.8)+(0.2)[1-0.8] & & \text { given information } \\
& =0.36 & & \text { simplify }
\end{aligned}
$$

(b) (six points) Determine the value of $\mathrm{P}(B \mid A)$.

$$
\begin{aligned}
\mathrm{P}(B \mid A) & =\mathrm{P}(A \cap B) / \mathrm{P}(A) & & \text { definition of conditional probability } \\
& =\mathrm{P}(A \mid B) \mathrm{P}(B) / \mathrm{P}(A) & & \text { multiplication rule } \leftarrow \\
& =(0.4)(0.8) / 0.36 & & \text { given information } \\
& =0.32 / 0.36 & & \text { given information }
\end{aligned}
$$

$\qquad$ < KEY > $\qquad$
5. (Montgomery and Runger, Edition 4, Problem 2-115). The following circuit operates if and only if there is a path of functional devices from left to right. The probability that each devices functions is shown. Assume that the probability that a device functions is independent of the other devices. We are interested in the probability that the circuit operates?

(a) (four points) What is the experiment?

Randomly choose a circuit. $\leftarrow$
(Maybe different assemblies or maybe one circuit at a random time.)
(b) (five points) Define notation and write the given information in your notation.

Let $D_{i}=$ "device $i$ functions, $i=1,2,3,4$.
Then $\mathrm{P}\left(D_{1}\right)=0.97$
$\mathrm{P}\left(D_{2}\right)=0.90$
$\mathrm{P}\left(D_{3}\right)=0.15$
$\mathrm{P}\left(D_{4}\right)=0.70$
and $D_{1}, D_{2}, D_{3}$ and $D_{4}$ are independent.
(c) (five points) In your notation, write the event that the circuit operates.

$$
D_{1} \cap\left(D_{2} \cup D_{3}\right) \cap D_{4} \quad \text { or } \quad\left(D_{1} \cap D_{2} \cap D_{4}\right) \cup\left(D_{1} \cap D_{3} \cap D_{4}\right)
$$

(d) (five points) Find the probability of the event in Part (c).

$$
\begin{aligned}
\mathrm{P}\left(D_{1}\right. & \left.\cap\left(D_{2} \cup D_{3}\right) \cap D_{4}\right) & & \\
& \left.=\mathrm{P}\left(D_{1}\right) \mathrm{P}\left(D_{2} \cup D_{3}\right) \cap D_{4}\right) & & \text { independent events } \\
& =\mathrm{P}\left(D_{1}\right)\left[\mathrm{P}\left(D_{2}\right)+\mathrm{P}\left(D_{3}\right)-\mathrm{P}\left(D_{2} \cap D_{3}\right)\right] \mathrm{P}\left(D_{4}\right) & & \text { expand the union } \\
& =\mathrm{P}\left(D_{1}\right)\left[\mathrm{P}\left(D_{2}\right)+\mathrm{P}\left(D_{3}\right)-\mathrm{P}\left(D_{2}\right) \mathrm{P}\left(D_{3}\right)\right] \mathrm{P}\left(D_{4}\right) & & \text { independence } \leftarrow \\
& =(0.97)[(0.90)+(0.15)-(0.90)(0.15)](0.70) & & \text { given }
\end{aligned}
$$

$\qquad$
$\qquad$ < KEY > $\qquad$
6. (Montgomery and Runger, Edition 4, Problem 2-135). A congested computer network has a 0.004 probability of losing a data packet. Packet loses are independent. A lost packet must be resent.
(a) (five points) What is the probability that an email message with 100 packets will need no packet to be resent?

Experiment: Choose a random message with 100 packets.
Let $R_{i}=$ "the $i$ th packet must be resent" for $i=1,2, \ldots, 100$.
Then for every $i, \mathrm{P}\left(R_{i}\right)=0.004$ and, by implication, $\mathrm{P}\left(R_{i}{ }^{\prime}\right)=0.996$.
$\mathrm{P}($ "no packet is resent" $) \quad=\mathrm{P}\left(R_{1}{ }^{\prime} \cap R_{2}{ }^{\prime} \cap \cdots \cap R_{100}{ }^{\prime}\right) \quad$ same event
$=\mathrm{P}\left(R_{1}{ }^{\prime}\right) \mathrm{P}\left(R_{2}{ }^{\prime}\right) \cdots \mathrm{P}\left(R_{100}{ }^{\prime}\right) \quad$ independence $\leftarrow$
$=(0.996)^{100} \quad$ given information
(b) (six points) What is the probability that an email message with four packets will need exactly one packet to be resent?

Experiment: Choose a random message with 4 packets.
Let $R_{i}=$ "the $i$ th packet must be resent" for $i=1,2,3,4$.
Then for every $i, \mathrm{P}\left(R_{i}\right)=0.004$ and, by implication, $\mathrm{P}\left(R_{i}{ }^{\prime}\right)=0.996$.
The event "exactly one packet is resent" can be written as

$$
\begin{aligned}
& {\left[R_{1} \cap R_{2}{ }^{\prime} \cap R_{3}^{\prime} \cap R_{4}^{\prime}\right] \cup\left[R_{1}^{\prime} \cap R_{2} \cap R_{3}{ }^{\prime} \cap R_{4}{ }^{\prime}\right]} \\
& \quad \cup\left[R_{1}^{\prime} \cap R_{2}^{\prime} \cap R_{3} \cap R_{4}^{\prime}\right] \cup\left[R_{1}^{\prime} \cap R_{2}^{\prime} \cap R_{3}^{\prime} \cap R_{4}\right]
\end{aligned}
$$

The four events in brackets are mutually exclusive, so sum their probabilities.
The four probabilities are equal, so consider only the first one:
Independence yields $\mathrm{P}\left(R_{1} \cap R_{2}{ }^{\prime} \cap R_{3}{ }^{\prime} \cap R_{4}{ }^{\prime}\right)=\mathrm{P}\left(R_{1}\right)\left(\mathrm{R}_{2}{ }^{\prime}\right)\left(\mathrm{R}_{3}{ }^{\prime}\right)\left(\mathrm{R}_{4}{ }^{\prime}\right)$.
The given information yields $(0.004)(0.996)^{3}$.
Therefore, $\mathrm{P}($ "exactly one packet is resent" $)=4(0.004)(0.996)^{3} \leftarrow$
(c) (six points) Suppose that ten email messages are sent, each with 100 packets. Determine the probability that at least one message will need at least one packet to be resent?

> Experiment: Choose a random message with 100 packets. Let $M_{i}=$ "the $i$ th message has at least one packet resent" for $i=1,2, \ldots, 10$. Then, from Part $(\mathrm{a}), \mathrm{P}\left(M_{i}^{\prime}\right)=(0.996)^{100}$ for $i=1,2, \ldots, 10$. $\begin{array}{ll}\mathrm{P}(\text { "at least one message will need at least one packet resent" }) \\ \quad=1-\mathrm{P}(\text { "no message needs at least one packet resent" }) & \text { complement } \\ =1-\mathrm{P}\left(M_{1}^{\prime} \cap M_{2}^{\prime} \cap \cdots \cap M_{10}^{\prime}\right) & \text { same event } \\ =1-\mathrm{P}\left(M_{1}{ }^{\prime}\right) \mathrm{P}\left(M_{2}{ }^{\prime}\right) \cdots \mathrm{P}\left(M_{10}{ }^{\prime}\right) & \text { independence } \leftarrow \\ =1-\left[(0.996)^{100}\right]^{10} & \text { given information } \\ =1-(0.996)^{1000} & \end{array}$

Alternatively (and easier), notice that all 1000 packets must not be resent.
